SILENTFLOR PUR 3.70mm

JUNE 2023

ARCHITECTURAL SPECIFICATIONS / BOQ

SPECIFICATION:

Supply and install Silentflor flexible PVC sheet flooring in 3.7mm thickness heterogeneous in construction with a 0.65mmclear PVC wear layer flooring shall incorporate a specially formulated polyurethane reinforcement, to significantly reduce maintenance costs, in accordance with EN ISO 10874/EN 685, the in-use classification must be at least 23,34,42 (0.65mm wear layer) as described in EN ISO 10874/EN 685: i.e. domestic areas with intense use; commercial areas with very heavy traffic; and general light industrial areas, tested to EN ISO 10140-3/EN ISO 140-8, the product should achieve an impact sound reduction of 19dB, regarding the EN 13893 test for slip resistance, the flooring shall be classified DS, making it suitable for use in areas which are predominantly dry, but with occasional wet spillage. When tested to DIN 51130, the flooring shall be classified as R10, in respect of flame spread, the flooring shall have been fully tested to EN 13501-1 and certified as having Class Bfl-S1, achieving the criteria EN ISO 9239-1 \geq 8kW/m2 and the mandatory requirement of EN ISO 11925-2 pass, tested to EN 20105-B02 Method 3 as having a pass to \geq 6, the product must have been fully tested for abrasion resistance and meet the requirements of abrasion Group T, as defined in EN 651, in respect of residual indentation, the flooring shall have been fully tested to EN 433 as having a pass to <0.2mm, the flooring must be available in 2.01 metre width, including a 0.01 metre selvage for on-site trimming, to minimise the number of joints, this product does not accumulate static charges above 2kV and is classified as 'antistatic' when tested to EN 1815

INSTALLATION: (PLEASE NOTE: ALWAYS USE COMPATIBLE PRODUCTS FROM ONE SUPPLIER)

Please note the following: Due to extreme temperature fluctuations in South Africa and Africa, we DO NOT recommend the method of cold welding. Polyflor SA recommends hot welding of heterogeneous products.

This section is intended for Polyflor heterogeneous sheet vinyl ranges with transparent wear layer/print construction. In general, the installation procedure is the same as that detailed in Installation of Homogeneous and Safety vinyl sheet and reference should be made to this section for in-depth advice. Included below are details of how installation differs from homogeneous vinyl sheet, specifically in relation to alignment of adjacent sheets and welding options.

5.1 ALIGNMENT OF DECORATION

This type of floorcovering features a print layer with a regular, repeat decoration (e.g., wood plank). With wood effect designs, to maximise the final appearance of the installation and to ensure the decorative effect is not lost, it is important that care is taken to align the plank decoration of each adjacent sheet. All none-wood effect designs MUST be reverse laid.

Once the adjacent sheets are aligned, the seam should be cut using one of the following methods: Using a straight edge and keeping the utility knife upright, cut through both layers to ensure there is a tight seam. With wood effect designs, the edge of the printed plank can be used in the lengthwise direction as a guide. Once the seam is cut, discard the waste material, and check the final appearance.

Or

Using a straight edge and utility knife, cut off the selvage of the top sheet of the wood effect designs, using the edge of the printed plank in the lengthwise direction as the guide. Discard the waste strip. Then, using the cut edge as a guide, set a proprietary seam cutter to cut the lower sheet. Discard the waste strip and check the final appearance.

Once the seams have been dry cut, the vinyl sheets can be adhered to the substrate. Fold back all the sheets halfway and apply an adhesive approved by Polyflor, following the adhesive manufacturer's instructions and recommendations.

Working from the centre of the room, fold the sheets back into their original position, using a rolling motion to reduce the risk of trapping air. Using a 68kg roller starting in the width direction, roll the floor to expel any air bubbles and ensure good contact with the adhesive, substrate, and the back of the sheet vinyl.

Repeat in the lengthwise direction. Repeat the whole rolling process approximately 4 hours later.

5.2 WELDING THE SHEET

There are two methods of welding that are recommended for heterogeneous vinyl sheet floorcoverings with a transparent wear layer/print construction.

5.2.1 Hot Welding

Once the adhesive is cured, normally after 24 hours, the seam can be grooved out. This can be done by using an electric grooving machine. The groove should not be deeper than 2/3rds thickness of the wear layer for the U groove.

A. Remove all dust and debris prior to welding.

B. Using an appropriate vinyl weld rod, test the weld fusion on a scrap piece of the material. Once you are happy with the heat settings and resultant weld, proceed to weld all the pre-grooved seams.

C. On completion, and whilst the weld is still warm, carry out the first trim. This should be carried out using Mozart trimming knife.

D. The final trim should be carried out once the weld has completely cooled (after 45 min) and should be done using the Mozart trimming knife.

Note: The welding technique described will provide a very strong mechanical weld. Should you require a much thinner line whilst at the same time providing a continuous surface, we suggest that in these instances, and using the technique described, only the wear layer be grooved out. This will result in a much narrower weld whilst still preventing ingress of dirt or moisture.

5.3 SUBFLOORS

In common with the installation of any type of flooring, the subfloor should not only be in sound condition and a moisture test must be conducted prior to installation, but also free of any contaminants, like oil, paint, preservative treatments or other forms of marking, such treatments, or other forms of marking, such as a permanent marker pen.

Similarly, no markings should be applied to the back of heterogeneous flooring.

MAINTENANCE: NOTE: NEVER USE A BLACK PAD TO SCRUB A PUR COATED FLOOR

To maximize efficiency of the cleaning system and minimize costs taking advantage of the Polyflor PUR-polyurethane reinforcement cross linked and UV cured finish, the following is recommended:

1.Post Installation:

•All loose dirt such as dust, grit, sand etc. must be removed, preferably by vacuuming the floor.

•The floor should then be cleaned using a neutral detergent, diluted as per the manufacturer's instructions, machine scrubbed and dirty cleaning solution wet vacuumed off the floor. (If a wet vacuum is not available, a mop and wringer system can be used).

•Adhesive can be removed with an appropriate detergent/solution such as Polyflor Powerclean if necessary. As a principle, aggressive solvents should be avoided as these may affect the PUR finish. More powerful detergents such as PRO-INOX (previously Resinox) from Industroclean can be used to remove persistent soiling which is not removed by the initial clean.

•The floor should then be rinsed until all traces of the neutral detergent are removed and wet vacuumed to remove all traces of water.

2.Daily

•Sweep/mop using a disposable cloth system such as the Masslinn system or vacuum to remove dust and grit; (Ensure that the vacuum is fitted with a Hepa filtration system in a healthcare environment)

•Spot or damp mop where required using a neutral detergent such as PROCLEAN.

3.Interim or Weekly Clean (Depending on conditions)

•To remove light scuff marks.

Dry buff with a +- 1000 rpm ultra-high speed burnisher using a clean 3M pink eraser or white pad.

•To remove heavy scuff marks:

Scrub with a low speed burnisher and neutral detergent, Proclean-diluted 100ml: 10Lwith cold water using the green Eco Brilliance pad.

4. Periodically (3-9 monthly) depending on conditions

•If required, scrub with a +- 165 rpm machine fitted with a red or blue pad using neutral detergent PROCLEAN diluted 20:1 with cold water as appropriate. Rinse well with clean water and dry buff with white pad to restore finish.

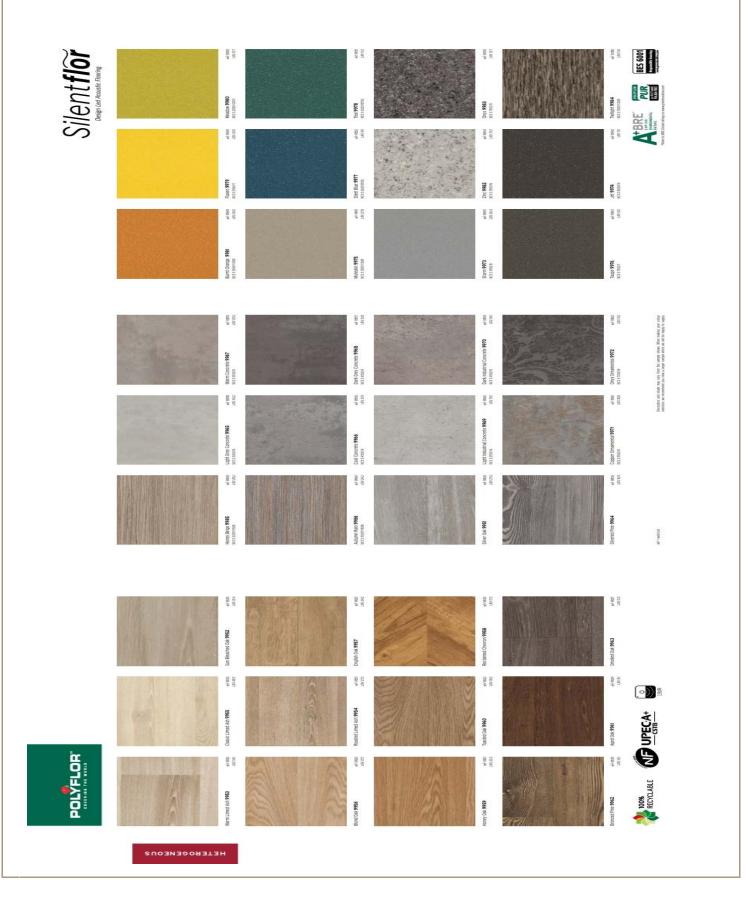

Please note that all PVC welding rod is not coated. We recommend the application of a layer of PUR sealer to all welds in a PUR sheeting floor to enhance maintenance procedures.

NB: to create a higher sheen on the floor, use a 1000 rpm machine using a clean white 3M pad or green Eco Brilliance Pad.

This program will keep maintenance costs to a minimum and requires no sealers.

Sufficient entrance or barrier matting is highly recommended and will greatly ease the maintenance programme.

SPECIALIST FLOORING & WALL PROTECTION PARTNER

Silent**flõr**

POLYFLOR

Elegantly combining contemporary and decorative design with superior acoustic performance, the Silentitor range has been experitly created for a wide range of commercial interiors. A robust, beautifully designed collection that achieves 19dB impact sound reduction, Silentifior provides a perfect solution for installations in the healthcare, office, residential, retail and lessue sectors. An environmentally preferable flooring collection, Silentifior is also 100% recyclable and has achieved NF UPEC A+ certification.
